Definition and examples. In probability theory, a normalizing constant is a constant by which an everywhere non-negative function must be multiplied so the area under its graph is 1, e.g., to make it a probability density function or a probability mass function. For example, if we define  $f(x) = e^{-x}$ ,  $x \in (-\infty, \infty)$  we have  $\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^{\infty} e^{-x} dx = 1$ , if we define a function  $f(x)$  as

Weak Law of Large Numbers. The weak law of large numbers (cf. the strong law of large numbers) is a result in probability theory also known as Bernoulli's theorem. Let  $X_1, \dots, X_n$  be a sequence of independent and identically distributed random variables, each having a mean and standard deviation. Define a new variable
