Electromagnetic or magnetic induction is the production of an electromotive force (i.e., voltage) across an electrical conductor in a changing magnetic field. Michael Faraday is generally credited with the discovery of induction in 1831, and James Clerk Maxwell mathematically described it as Faraday's law of induction.

Electromagnetic induction - Wikipedia

Electromagnetic induction is the production of voltage or electromotive force due to a change in the magnetic field. Electromagnetic induction was discovered by Michael Faraday in the 1830s. Many electrical components and types of equipment work based on the principle of electromagnetic induction.

The current frequency is usually constant in low radio-wave diapason (LW, MW, SW). The variable electromagnetic field around antenna can be decomposed into two terms: a "near" field that vanishes quickly with distance (a dipole field "attached" to the antenna) and a radiated field that propagates far away and vanishes as $1/r^2$. The radiated wave has the same frequency as the antenna.
