Now to turn this into an algorithm...if you want to factor a Gaussian integer G , you can find its norm N , and then factor that into prime integers. Then we work our way down this list, peeling off prime factors p of N that correspond to prime Gaussian factors q of our original number G . There are only three cases to consider, and two of them are trivial.

What's a nice method to factor gaussian integers?

The original question implies generating multiple random integers.. How can I generate integers between 0 and 9 (inclusive) in Python? Many responses however only show how to get one random number, e.g. `random.randint` and `random.choice`.. Multiple Random Integers

Modular arithmetic can be handled mathematically by introducing a congruence relation on the integers that is compatible with the operations on integers: addition, subtraction, and multiplication. For a positive integer n , two numbers a and b are said to be congruent modulo n , if their difference $a - b$ is an integer multiple of n (that is, if there is an integer k such that $a - b = kn$).
