Implicit Differentiation - Classwork Suppose you were asked to find the slope of the tangent line to the curve $x^2y^2 = 25$ at the point $(4, 3)$. First, we can solve for y . Next, take the derivative: and simplify. Now plug in the value of $x = 4$. Clearly, we have a problem. We have a \pm in our derivative.

****NOINLINE****Implicit differentiation is a way of differentiating a function that is written in terms of two or more variables, such as $f(x, y)$, and cannot be solved explicitly in terms of one variable. It is a special case of the chain rule, where the differential involves multiple variables, rather than just one.

The Solution Manual is exactly the same as the student manual except that the solutions with all important steps are shown. There is a one-to-one relationship between the pages of the student manual and the solution manual. So, for example, page 73 will have a series of problems and blank space for the students to write in the solutions.
