belongs to a group of organisms known as cnidarians or sometimes called coelenterates. This phylum also includes animals such as the jellyfish and sea anemone and the organisms that make up coral reefs.

What is the body form of a hydra? | AnswersDrive

Cnidarians have a complete digestive system with two openings. Cnidarians absorb their food across their body wall into a primitive gut cavity. Cnidarians use their tentacles to break down the captured prey before it is taken into the body through the mouth. Cnidarians only have one opening for digestion, located on the aboral side of the animal.

Many members of the Hydrozoa go through a body change from a polyp to an adult form called a medusa. However, all Hydra, despite being hydrozoans, remain as polyps throughout their lives.

how do hydras differ from other cnidarians in the class ...

Cnidarians range in size from a mere handful of cells for myxozoan through Hydra's 5–20 mm (0.20–0.79 in) long, to the Lion's mane jellyfish, which may exceed 2 m (6.6 ft) in diameter and 75 m (246 ft) in length. Prey of cnidarians ranges from plankton to animals several times larger than themselves.

Cnidaria - Wikipedia

Between these two tissue layers is the mesoglea, which, in Hydra is a thin sheet of protein and does not contain cells. In some cnidarians, such as larger jellyfish, the mesoglea is a thick jellylike layer and contains cells. Note the simplicity of the body plan. In this view you don't see any organs, just two layers of cells.

Cnidaria - Brian McCauley

The two body forms of cnidarians are called polyp and medusa. Polyps are sessile and reproduce asexually. Polyps include the hydra and anemone. The medusa is a free-swimming form (such as the jellyfish). Some cnidarians change from one form to the other during their lifetime, while others remain in one form for their whole lives.
