Kinetic energy is a scalar quantity; it does not have a direction. Unlike velocity, acceleration, force, and momentum, the kinetic energy of an object is completely described by magnitude alone. Like work and potential energy, the standard metric unit of measurement for kinetic energy is the Joule. As might be implied by the above equation, 1 ...

As you can see, the kinetic energy is quadrupled since  $4 \times 125 = 500$  Tricky kinetic energy problems. Problem # 3: Suppose a rat and a rhino are running with the same kinetic energy. Which one do you think is going faster? Solution: The only tricky and hard part is to use the kinetic energy formula to solve for v.

Potential energy is energy attributed to an object by virtue of its position. When the position is changed, the total energy remains unchanged but is converted to a different type of energy, like kinetic energy. The frictionless roller coaster is a classic potential and kinetic energy example problem.

Just use conservation of energy. It's way cleaner and easier. Find the total energy at the bottom of the hill just before the rider enters the rough surface, and use  $E_0 - W = E_f = 0$  (because the rider lost all potential energy in coming down the hill which was converted to kinetic energy, and then the rider and sled have -W done on them by the surface)
