Small modular reactors (SMRs) are a type of nuclear fission reactor which are smaller than conventional reactors, and manufactured at a plant and brought to a site to be assembled. Modular reactors allow for less on-site construction, increased containment efficiency, and heightened nuclear materials security.

Nuclear fuel is material used in nuclear power stations to produce heat to power turbines. Heat is created when nuclear fuel undergoes nuclear fission.. Most nuclear fuels contain heavy fissile actinide elements that are capable of undergoing and sustaining nuclear fission. The three most relevant fissile isotopes are Uranium-233, Uranium-235 and Plutonium-239.

Introduction to nuclear energy. Everything around you is made up of atoms. In the late 1930s, it was discovered that some particularly large atoms can split in two (or fission), releasing a shockingly large amount of energy. When these atoms were arranged properly in a machine, one splitting atom can cause nearby ones to split, creating a chain reaction.

Latent Heat of Vaporization of Nitrogen is 2.7928 kJ/mol. Specific Heat. Specific heat, or specific heat capacity, is a property related to internal energy that is very important in thermodynamics. The intensive properties  $c_v$  and  $c_p$  are defined for pure, simple compressible substances as partial derivatives of the internal energy  $u(T, v)$  and enthalpy  $h(T, p)$ , respectively:

Nuclear fission is a nuclear reaction in which the nucleus of an atom splits into smaller parts (lighter nuclei). The fission process often produces free neutrons and photons (in the form of gamma rays), and releases a large amount of energy. In nuclear physics, nuclear fission is either a nuclear reaction or a radioactive decay process. The case of decay process is called spontaneous fission ...
