Fatigue limit, endurance limit, and fatigue strength are all expressions used to describe a property of materials: the amplitude (or range) of cyclic stress that can be applied to the material without causing fatigue failure. Ferrous alloys and titanium alloys have a distinct limit, called the endurance limit, which is the amplitude of completely reversed bending stress below which there ...

Huynh et al. (2011) carried out a recycling analysis of Si substrate for spinnable carbon nanotube growth. 100% regrowth in forest height and mass yield of CNTs were achieved in the first four cycles, but both of these parameters fell to about 20% in the fifth cycle. A decrease in nanotube diameter and increase in areal density were also observed. ...

This section introduces the main tools currently used in tribological modeling, starting from analytical models and discussing continuous and discrete mechanical and multiphysical methods suitable for simulations characterized by different time- and length-scales (see Fig. 1 for a map of representative tribological models built across the scales), namely finite and boundary element methods ...

The Molecular Kink Paradigm proceeds from the intuitive notion that molecular chains that make up a natural rubber (polyisoprene) network are constrained by surrounding chains to remain within a 'tube'. Elastic forces produced in a chain, as a result of some applied strain, are propagated along the chain contour within this tube. Fig. 2 shows a representation of a four-carbon isoprene ...
