That rejection also applies to other spread-spectrum signals that do not have the right key. Thus different spread-spectrum communications can be active simultaneously in the same band, such as CDMA. Note that spread spectrum is a wideband technology, but the reverse is not true: wideband techniques need not involve spread-spectrum technology.

orthogonal communication system complex should be made as large as possible to reduce E<sub>Jeff</sub>, i.e., the complex should be designed to use all of the available bandwidth. The energy-optimal communication strategy (K S 1) using a single one of the K available communication links, is called a pure spread-spectrum strategy.

The manner of inserting this code defines precisely the SS technique in question. The term "spread spectrum" refers to the expansion of signal bandwidth, by several orders of magnitude in some cases, which occurs when a key is attached to the communication channel.
