In mathematics, the Gaussian or ordinary hypergeometric function ${}_2F_1(a,b;c;z)$ is a special function represented by the hypergeometric series, that includes many other special functions as specific or limiting cases. It is a solution of a second-order linear ordinary differential equation (ODE). Every second-order linear ODE with three regular singular points can be transformed into this ...

In mathematics, a confluent hypergeometric function is a solution of a confluent hypergeometric equation, which is a degenerate form of a hypergeometric differential equation where two of the three regular singularities merge into an irregular singularity. (The term confluent refers to the merging of singular points of families of differential equations; confluere is Latin for "to flow together".)

Definition 1: Suppose an experiment has the following characteristics:.. the experiment consists of n independent trials, each with two mutually exclusive outcomes (success and failure); for each trial the probability of success is p (and so the probability of failure is $1 - p$); Each such trial is called a Bernoulli trial. Let x be the discrete random variable whose value is the number of ...

All hypothesis tests are conducted the same way. The researcher states a hypothesis to be tested, formulates an analysis plan, analyzes sample data according to the plan, and accepts or rejects the null hypothesis, based on results of the analysis. It gets a LOT more complex if you're playing a card game, you have a certain number of cards in your hand, and you want to know your odds of getting a certain card if you are drawing a certain number of cards. You have to use something called a hypergeometric distribution to figure out the odds. The formula is: $H(n) = \frac{C(X, n) * C(Y - X, Z - n)}{C(Y, Z)}$

Airy Functions. There are four varieties of Airy functions: $Ai(x)$, $Bi(x)$, $Ai(-x)$, and $Bi(-x)$. Of these, $Ai(x)$ and $Bi(x)$ are by far the most common, with $Ai(-x)$ and $Bi(-x)$ being encountered much less frequently. Airy functions commonly appear in physics, especially in optics, quantum mechanics, electromagnetics, and radiative transfer.

We study geometric properties of GL-spaces. We demonstrate that every finite-dimensional GL-space is polyhedral; that in dimension 2 there are only two, up to isometry, GL-spaces, namely the space whose unit sphere is a square (like ℓ_∞^2 or ℓ_1^2) and the space whose unit sphere is an equilateral hexagon.
