Entering the  $\chi^2$  sum of 23.8872 and the degrees of freedom (32, one less than the 33 possible outcomes of the experiment) into the Chi-Square Calculator gives a probability of 0.85. This falls within the "fat region" of the probability curve, and thus supports the null hypothesis, just as we expected. Next, we invite our subject to attempt to influence the random output of our generator.
