Hypothesis testing is the use of statistics to determine the probability that a given hypothesis is true. The usual process of hypothesis testing consists of four steps. 1. Formulate the null hypothesis  $H_0$  (commonly, that the observations are the result of pure chance) and the alternative hypothesis  $H_a$  (commonly, that the observations show a real effect combined with a component of chance ...

The null hypothesis is one of two mutually exclusive hypotheses in a hypothesis test. The null hypothesis states that a population parameter equals a specified value. If your sample contains sufficient evidence, you can reject the null hypothesis and conclude that the effect is statistically significant. The null hypothesis is often displayed as  $H_0$ . In every experiment, there is an effect or ...

Alternative Hypothesis. The alternative hypothesis is the hypothesis used in hypothesis testing that is contrary to the null hypothesis. It is usually taken to be that the observations are the result of a real effect (with some amount of chance variation superposed).

The weak and the strong cosmic censorship hypotheses are two mathematical conjectures about the structure of gravitational singularities arising in general relativity.. Singularities that arise in the solutions of Einstein's equations are typically hidden within event horizons, and therefore cannot be observed from the rest of spacetime. Singularities that are not so hidden are called naked.

An experiment is a procedure carried out to support, refute, or validate a hypothesis. Experiments provide insight into cause-and-effect by demonstrating what outcome occurs when a particular factor is manipulated. Experiments vary greatly in goal and scale, but always rely on repeatable procedure and logical analysis of the results.
