In functional analysis, a bounded linear operator is a linear transformation L between normed vector spaces X and Y for which the ratio of the norm of L(v) to that of v is bounded above by the same number, over all non-zero vectors v in X.In other words, there exists some ≥ such that for all v in X ‖ ‖ ≤ ‖ ‖. The smallest such M is called the operator norm ‖ ‖ of L.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

At the heart of all organizations is data. However, at the heart of a digitally transformed organization is trusted data. Organizations in the midst of a digital transformation need data that can be trusted and securely accessed by everyone in the organization to enable new product creation, superior customer experiences or deeper marketplace insights.

Examples. The space Q of rational numbers, with the standard metric given by the absolute value of the difference, is not complete.Consider for instance the sequence defined by = and + = +.This is a Cauchy sequence of rational numbers, but it does not converge towards any rational limit: If the sequence did have a limit x, then by solving = + necessarily x 2 = 2, yet no rational number has ...
