@harinder – controlling a stepper motor directly from ladder logic is rare. Traditional PLC scan times aren't fast enough to step the motors at a reasonable speed, and you require special output hardware to drive the stepper motor coils without inducing too much current, and giving you improved control like microsteps.

"Ladder" diagrams. Ladder diagrams are specialized schematics commonly used to document industrial control logic systems. They are called "ladder" diagrams because they resemble a ladder, with two vertical rails (supply power) and as many "rungs" (horizontal lines) as there are control circuits to represent.

One of the more controversial concepts in Agile Modeling is that agile models and agile documents are sufficient for the task at hand, or as I like to say they are just barely good enough (JBGE) . In this article I make the following critical points about a model or document (an artifact) being just barely good enough:

We have made this list for pragmatic purposes. We did no try to find the best programming language for each possible niche. We simply listed the sectors for which we could find at least two programming languages which fit reasonably well.

The Best Programming Languages for each Situation

Ladder logic is a programming language that creates and represents a program through ladder diagrams that are based on circuit diagrams. It is mainly used in developing programs or software for programmable logic controllers (PLCs), which are used in industrial applications.

Logic (from the Ancient Greek: λογική, romanized: logikḗ) is the systematic study of the form of valid inference, and the most general laws of truth. A valid inference is one where there is a specific relation of logical support between the assumptions of the inference and its conclusion.In ordinary discourse, inferences may be signified by words such as therefore, thus, hence, ergo ...

Exadata already has been displacing use of EMC VMAX in some accounts. With Oracle's committments, although many features have lagged, having a true 2nd source for storage to run mission-critical apps on is just too critical not to support.

In computer science, functional programming is a programming paradigm—a style of building the structure and elements of computer programs—that treats computation as the evaluation of mathematical functions and avoids changing-state and mutable data. It is a declarative programming paradigm in that programming is done with expressions or declarations instead of statements.

Flow Control MATLAB supports the basic flow control constructs found in most high level programming languages. The syntax is a hybrid of C and Fortran and I often create polyglot statements which lead to the joyless task of squashing trivial bugs.
